

Askoros HRU-LR2

HRU is a device to be used in all the maritime sector, oil platforms, cruise ships, military ships, yachts, leisure crafts, as well as evacuation systems in the aviation sector.

It has been developed for the emergency conditions where the life rafts can't be manually released, as the vessel starts to submerge.

An HRU-LR2 allows a liferaft and/or EPIRP to launch automatically if there is no time for the crew to launch it manually.

Depending on the type of emergency, a vessel could sink very quickly and with little warning.

It is therefore important that every liferaft and EPIRP should have an HRU fit to the lashing that secures.

We are proud that our own product ASKOROS brand HRU is our best seller.

In addition, it has RINA approval, making it more durable and reliable.
